The Chemistry of Heterocyclic Compounds, since its inception, has been recognized as a cornerstone of heterocyclic chemistry. Each volume attempts to discuss all aspects — properties, synthesis, reactions, physiological and industrial significance — of a specific ring system. To keep the series up-to-date, supplementary volumes covering the recent literature on each individual ring system have been published.

Compounds classified as heterocyclic probably constitute the largest and most varied family of organic compounds. After all, every carbocyclic compound, regardless of structure and functionality, may in principle be converted into a collection of heterocyclic analogs by replacing one or more of the ring carbon atoms with a different element.

A heterocyclic compound or ring structure
is a cyclic compound that has atoms of at
least two different elements as members of
its ring. Heterocyclic chemistry is the
branch of organic chemistry dealing with
the synthesis, properties, and applications
of these heterocycles. Examples of

Heterocyclic aromatic compounds contain in their molecules at least one heteroatom and one carbon (see Chapter 16).

Hydrogen connected to carbon atoms is frequently part of the heterocyclic molecules. Substitution of these hydrogen atoms with halogens leads to halogenated aromatic heterocyclic compounds.
